PROJECTS

E-commerce Website   **2022**

- Collaborated with multiple classmates using **agile** software development strategies to create a functional e-commerce website that allowed users to browse a storefront, place products in their cart, checkout by entering shipping and credit card information, and receiving a verification email their products had shipped.
- Utilized front-end languages **HTML** and **CSS** to design the website while **Python** was used on the backend to add functionality and **Node JS** brought both parts together.
- Planned out project relationships and pulled data from instructors existing product database using **MySQL**.

RISC-V Simulator   **2022**

- Simulates computer system memory by decoding and disassembling instructions from **RV32I** binary executable files.
- Emulated by a RISC-V hart through usage of 32 different registers.
- Written in **C++** and utilizes fifteen different program files intertwined and working on top of each other.
